

Changing font sizes in equations

Andrew Roberts

<http://www.comp.leeds.ac.uk/andyr>

Probably a rare event, but there may be a time when you would prefer to have some control of the size. For example, using text-mode maths, by default a simple fraction will look like this: $\frac{1}{2}$ where as you may prefer to have it displayed larger, like when in display mode, but still keeping it inline, like this: $\frac{1}{2}$.

A simple approach is to utilise the predefined sizes for maths elements:

<code>\displaystyle</code>	Size for equations in display mode
<code>\textstyle</code>	Size for equations in text mode
<code>\scriptstyle</code>	Size for first sub/superscripts
<code>\scriptscriptstyle</code>	Size for subsequent sub/superscripts

A classic example to see this in use is typesetting continued fractions. The following code provides an example.

```
\begin{equation}
  x = a_0 + \frac{1}{a_1 + \frac{1}{a_2 + \frac{1}{a_3 + a_4}}}
\end{equation}
```

$$x = a_0 + \frac{1}{a_1 + \frac{1}{a_2 + \frac{1}{a_3 + a_4}}} \quad (1)$$

As you can see, as the fractions continue, they get smaller (although they will not get any smaller as in this example, they have reached the `\scriptscriptstyle` limit. If you wanted to keep the size constant, you could declare each fraction to use the display style instead, e.g.,

```
\[ x = a_0 + \frac{1}{\displaystyle a_1
+ \frac{1}{\displaystyle a_2
+ \frac{1}{\displaystyle a_3 + a_4}}}\]
```

$$x = a_0 + \frac{1}{a_1 + \frac{1}{a_2 + \frac{1}{a_3 + a_4}}} \quad (2)$$
